Abstract
This paper investigates the relationship between the management efficiency and the firms profitability for a sample of 13 auto manufacturing companies listed on the Bombay Stock Exchange, located in Pune for the period of 5 yrs from 2006 to 2010. Management efficiency is an important component of corporate financial management because it directly affects the profitability of the firms. Considering the importance of profitability for the survival of a business and the role of efficient management to achieve this aim, this paper explores the relationship between management efficiency and profitability in Automobile Industry of India. For this purpose, 13 auto manufacturing companies are located in Pune were chosen as the sample. The analysis is carried out using Minitab 14 and conducting Pearson Coefficient correlation test on variables of the study including Gross Profit Ratio (GPR) and Assets Turnover Ratio (ATR). The central conclusion of the study is that profitability and management efficiency are highly correlated to each other and based on the results of the study recommendations for improving the management efficiency and profitability in this industry are suggested.

Keywords: Management efficiency, profitability, automobile Industry, asset turnover ratio, gross profit Ratio

Introduction
This paper investigates the relationship between the management efficiency and the firms profitability for a sample of 13 auto manufacturing companies listed on the Bombay Stock Exchange, located in Pune for the period of 5 years from 2006 to 2010. Management efficiency is an important component of corporate financial management because it directly affects the profitability of the firms.

Every business is most concerned with its profitability. Profitability is the ability to make profit from all the business activities of an organization, company, firm, or an enterprise. It shows how efficiently the management can make profit by using all the resources available in the market. One of the most frequently used tools of financial ratio analysis is profitability ratios, which are used to determine the company's bottom line. Profitability ratios show a company's overall efficiency and performance. Profitability and management efficiency are usually taken to be positively associated: poor current profitability may threaten current management efficiency and vice versa; poor management efficiency may threaten profitability (Eskandari, 2007).

The automotive industry in India is now working in terms of the dynamics of an open market. Many joint ventures have been set up in India with foreign collaboration, both technical and financial with leading global manufacturers. Also a very large number of joint ventures have been set up in the auto-components sector and the pace is expected to pick up even further. The Government of India is keen to provide a suitable economic and business environment conducive to the success of the established and prospective foreign partnership ventures (www.osec.ch, 2008).

Profitability ratios show a company's overall efficiency and performance (Eskandari, 2007). We can divide profitability ratio into two types: margins and returns ratio that show margins represent the firm's ability to translate sales dollars into profits at various stages of management ratios that show returns represent the firm's ability to measure the overall efficiency of the firm in generating returns for its shareholders. The ratios that are typically used to analyze how well a company uses its assets and liabilities internally. Efficiency Ratios can calculate the turnover of receivables, the repayment of liabilities, the quantity and usage of equity and the general use of inventory and machinery.

Empirically examined the relationship between profitability and liquidity, as measured by current ratio and cash gap (cash conversion cycle) on a sample of 929 joint stock companies in Saudi Arabia. Using correlation and regression analysis, Eljelly (2004) found significant negative relationship between the firm's profitability and liquidity level, as measured by current ratio. This relationship is more pronounced for firms with high current ratios and long cash conversion cycles. At the industry level, however, he found that the cash conversion cycle or the cash gap is of more importance as a measure of liquidity than current ratio that affects profitability. The firm size variable was also found to have significant effect on profitability at the industry level.

Lazaridis & Tryfonidis (2006) conducted a cross sectional study by using a sample of 131 firms listed on the Athens Stock Exchange for the period of 2001-2004 and found statistically significant relationship between profitability, measured through gross operating profit, and the cash conversion cycle and its components (accounts receivables, accounts payables, and inventory). Based on the results analysis of annual data by using correlation
and regression tests, they suggest that managers can create profits for their companies by correctly handling the cash conversion cycle and by keeping each component of the conversion cycle (accounts receivables, accounts payables, and inventory) at an optimal level.

**Variables**

Gross profit ratio (GP ratio)

It is the ratio of gross profit to net sales expressed as a percentage. It expresses the relationship between gross profit and sales. The basic components for the calculation of gross profit ratio are gross profit and net sales. A net sale means those sales minus sales returns. Gross profit would be the difference between net sales and cost of goods sold (Porter, 1980). Following formula is used to calculate gross profit ratios:

\[
\text{Gross Profit Ratio} = \frac{\text{Gross profit}}{\text{Net sales}} \times 100
\]

Asset turnover ratio

Asset turnover is a financial ratio that measures the efficiency of a company's use of its assets in generating sales revenue or sales income to the company (Bodie et al., 2004). Companies with low profit margins tend to have high asset turnover, while those with high profit margins have low asset turnover. Companies in the retail industry tend to have a very high turnover ratio due mainly to cutthroat and competitive pricing.

\[
\text{Asset turnover ratio} = \frac{\text{Net Sales Revenue}}{\text{Total Assets}} \times 100
\]

It should be noted that the asset turnover ratio formula does not look at how well a company is earning profits relative to assets. The asset turnover ratio formula only looks at revenues and not profits. This is the distinct difference between return on assets (ROA) and the asset turnover ratio, as return on assets looks at net income, or profit, relative to assets.

**Hypothesis**

The management efficiency is an influencing factor on profitability in Indian automobile industry.

**Research methodology**

Research question: For testing the hypothesis, this question comes to the mind of researcher, whether the management efficiency is a key influencing factor on profitability in Indian automobile industry or not?

Variables of the study: For answering to this question, the data collected through financial statements and annual reports of the industry were analyzed and compared. In doing so and to find out the existence of the relation between two variables, the gross profit ratio (GPR) was computed for profitability ratio and assets turnover ratio (ATR) for efficiency ratio (Kothari, 2008). Target population and sample: The target population of the study includes all automobile companies located in Pune; which consist of 13 Auto industries. The sample size is equal to the population.

Null & alternative hypothesis: Since the objective of this study is to examine the relation between profitability and management efficiency, a set of testable hypothesis (Adel Azar & Momeny, 2010) (the null hypothesis Versus alternative hypothesis) the null and alternative hypothesis considered as follow:

\[ H_0: \text{there is no significant relation between GPR and ATR.} \]

\[ H_1: \text{there is a significant relation between GPR and ATR.} \]

**Statistical analysis tools:** The hypotheses of the study were examined by using Minstat statistical software. To identify the relation between variables of the study, linear regression tests were conducted.
regression and coefficient correlation and coefficient of determination tests were used. For testing the significant of a dependent variable over the independent variable, t-test was utilized.

Results

For testing hypotheses GPR and ATR are calculated for 13 companies from 2006 to 2010 as follow:

Gross profit ratio may be indicated to what extent the selling prices of goods per unit may be reduced without incurring losses on operations. It reflects efficiency with which a firm produces its products. As the gross profit is found by deducting cost of goods sold from net sales, higher the gross profit better it is. There is no standard GP ratio for evaluation (www.bseindia.com, 2011). It may vary from business to business. However, the gross profit earned should be sufficient to recover all operating expenses and to build up reserves after paying all fixed interest charges and dividends. The GP ratio indicates that from every single Rs of sale how much percent of gross profit has been made? The calculated GP ratio for Indian companies shows that Auto line industries and ASAL Ltd have highest gross profit of Indian automobile industries in Pune city (Table 1).

Table 2 shows the asset turnover ratio of selected companies for Maharashtra Scooters and kinetic engineering are very high which could be the management team of these two companies are more effective to create more profit. High asset turnover ratio indicates more efficient of management to employ assets and low asset turnover ratio indicates high investment on assets.

Five years consolidated together (from 2005-06 to 2009-10)

In this case, the regression equation is GPR = 9.61 + 3.087ATR. Table 3 & 3a shows the Coefficient of correlation between GPR and ATR is R = 58% and shows average positive correlation. Coefficient of determination R-Sq=33% shows that 33%of change in GPR is due to change in ATR. The p-value is 0.00 which is less than 5%. Therefore, Null hypothesis is rejected and alternative hypothesis is accepted. As such five years together, there is a significant relationship between GPR and ATR. If the ATR change to one unit the GPR changes to 3.1 unit with P-value=0.00.

Limitations

This study is limited to the sample of Indian Auto manufacturing industry firms. The findings of this study could only be generalized to automobile industry similar to those that were included in this research. In addition, the sample size is small.

Discussion and conclusion

As per the study GP ratio indicates that from every single rupee of sale, how much percent of gross profit has been made. The calculated GP ratio for Indian companies shows that autoline industries and ASAL Ltd have highest gross profit of Indian automobile industries in Pune city (Table 1) and the asset turnover ratio of selected companies for Maharashtra Scooters and kinetic engineering are highest in this matter which could be resulted the management team of these two companies are more effective to create more profit. High asset turnover ratio indicates more efficient of management to employ assets and low asset turnover ratio indicates high investment on assets. The analysis of data, reveals that the findings of five years together (from 2006 to 2010) coefficient of correlation between GPR and ATR is R=58% with average positive correlation. Coefficient of determination R-Sq=33% shows that 33%of change in GPR is due to change in ATR. The p-value is 0.00 which is less than 5%. Therefore, Null hypothesis is rejected and alternative hypothesis is accepted. As such five years together, there is a significant relationship between GPR and ATR. If the ATR change to one unit the GPR changes to 3.1 unit with P-value=0.00. So the hypothesis approved. The conclusion of the study is that profitability and management efficiency are highly correlated to each other and based on the results of the study; recommendations for improving the management efficiency and profitability in this industry are suggested.
